SUMMARY

Solution Architect with an engineering + frontline-support background. Grew with Tulip from \$20M – \$75M ARR as support engineering scaled 3 – 13 (US-only – global). Led the company's most critical incidents — cluster outages, production-crippling MongoDB bottlenecks — with customer comms under C-level directive. Live debugging, API integration, load-testing frameworks, and reproducible diagnostic tooling for customers and internal teams.

SKILLS

Skills: Customer Architecture Design, Demo Building, Live Debugging, POCs, Reproducible Demos, Integration Design, API Integrations, Technical Workshops, Enterprise Account Support, Stakeholder Alignment, Executive Communication, Implementation Partnership, Cross-functional Leadership, Incident Response, Root Cause Analysis, Escalation Management, Customer Onboarding, agile, TypeScript, React

Technical: MongoDB, SQL, TypeScript, Python, Node.js, React, Docker, Grafana, Loki, Performance Engineering, Claude Code, Anthropic SDK, Git, GitHub Actions, MongoDB

EXPERIENCE

Tulip Interfaces

Nov 2021 – Present

Joined as support engineer #3; grew with Tulip from \$20M – \$75M ARR as support engineering scaled 3 – 13 (US-only – global); led the company's most critical incidents across support and SRE.

TPM | SRE

Jun 2025 – Apr 2026

- FY 2026 Tulip Grow Award — cited across CSMs, engineering, product, and leadership as the go-to for tough technical + customer-facing problems and cross-functional leadership.
- Led resolution of the most critical incidents in company history — multi-customer cluster outages, production-crippling MongoDB bottlenecks, and regressions on Tulip's largest enterprise accounts — as escalation point across SRE, engineering, and C-suite.
- Architected a generalized load-testing framework for 100+ API endpoints across 5+ backend services, adopted by 5+ engineering teams with automated runs and live Grafana + Loki dashboards.

Technical Support Engineer

Apr 2023 – May 2025

- Led resolution of multi-customer cluster outages and MongoDB performance bottlenecks under C-level directive — owning bug reproduction, RCA, customer comms, and remediation with Engineering + Product.
- Operated as combined SWE + Support on escalations (custom MongoDB scripts, Loki queries) while partnering closely with CSMs across Product, Engineering, and Support.
- Designed and shipped a drag-and-drop visual MongoDB interface that replaced mongosh internally; led UX research for internal support-automation tooling including AI-assisted workflows.

Product Support Engineer

Nov 2021 – Apr 2023

- Delivered Tier-2/3 support across a complex manufacturing + biotech SaaS platform, building trusted relationships with CSMs, engineers, and customers that carried into every later role.
- Built internal documentation and debugging tooling that shortened new-hire onboarding and bug-investigation time.

Bubble Holographic Systems 2017 – Present

Founder & Product Architect

- Building a 3D graphics system and no-code spatial builder; originated as my Brandeis CS Honors Thesis.
- Selected for SparkTank.

EDUCATION

Brandeis University — BA, Computer Science

2017 – 2021

- Computer Science Honors | Dean's List '20–'21
- Thesis: "Bubble: An Interface for Programming in Three-Dimensional Virtual Reality Environments."

PROJECTS

Job Graph — semantic knowledge graph over 21,000+ job postings from 79 companies; scrapers across five ATSes, AI-reviewed resume-tailoring editor, built on my own visual MongoDB explorer (MiniMongo). TypeScript, React Flow, MongoDB.

Stock Tool — automated trading platform (40-package TypeScript monorepo, hexagonal architecture); backtest-gated release pipeline lifted Sharpe 1.46 – 2.42 and cut max drawdown 6x, with sub-minute signal-to-trade alerting. TypeScript, Node.js, React, PostgreSQL, Redis.

Kraken Unchained — microservice dependency-analysis tool injecting faults and simulated load against a service graph to surface resilience issues before production. Python, D3.js, Docker.

FlowNode — open-source visual DAG workflow builder with an extensible node architecture powering drag-and-drop automation. TypeScript, React Flow.
